XXX CORPORATON CUSTOMISES MOSS INTRANET CORPORATE PORTAL

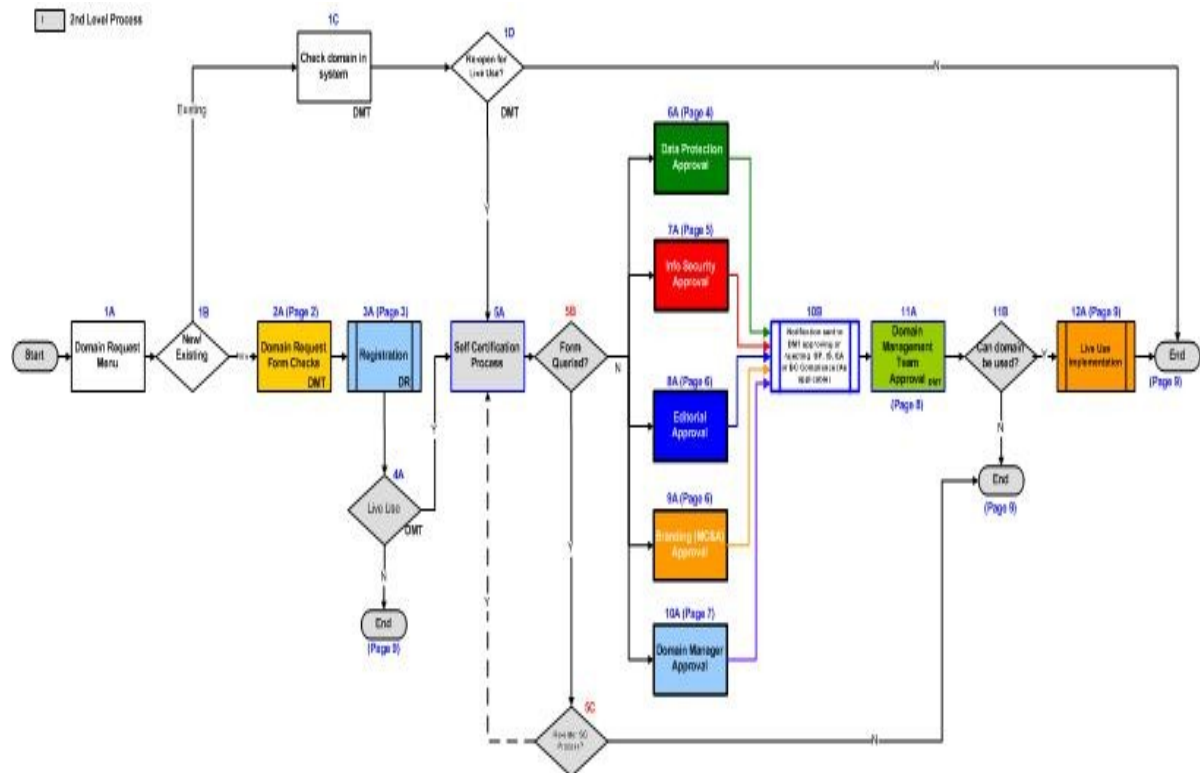

As one of the leading broadcasting companies in the world, XXX had one corporate Intranet Portal for Collaboration and sharing information among its own workers. They wanted to have their MOSS Portal customized to get maximum productivity and efficiency from their employees. CCS has developed and deployed custom solutions on their Microsoft Office SharePoint Server to achieve this.

SITUATION

The main challenge was to improve Collaboration and increase productivity. Even though XXX was using out of the box workflows, web parts, and other features in the MOSS, they were not up to their expectations. Many additional workflows and other features were required to fully automate the system. Also, integration with some other line of business applications was envisaged. The company also wanted to have additional security up to field level for the contents.

SOLUTION

CCS proposed designing and developing custom features to automate their business process. CCS created custom web parts, application pages and content types using Visual Studio to automate the process and to integrate with other applications. CCS has also created custom workflows to automate complex business processes and forms using Visual Studio and MS InfoPath 2007.

BENEFITS

The company saw immediate results after deploying the solution proposed by CCS. The major improvement is the control over time and processes. People started to receive emails as soon as they are assigned task. They are able to know the status of a particular process very quickly from the workflow status page. Tasks are escalated to next level, if needed, automatically by the custom developed system. The custom web parts developed by CCS allowed people to personalize their own pages in the way they wanted to view it. Another improvement was on the security. They now have more control over the contents up to field level.
