XXX DEVELOPS EMPLOYEE PRODUCTIVITY SOFTWARE

As one of the leading providers of software solutions and services related to Employee productivity in UK, XXX needed Employee productivity software where employees can invite, suggest and share ideas. To achieve this, they developed a custom solution that can be deployed in MOSS 2007 with the help of CCS Technologies.

SITUATION

Generating and fine-tuning an Idea is often a very difficult thing to manage and maintain. As the number of employees increases, it will again become more complicated and difficult to manage. Even though there are skilled persons in diverse areas, they find it difficult to reach everyone for solving a problem, requesting new ideas, and refining existing ones. As the company grows and spreads across different countries it is going to be a herculean task.

SOLUTION

MOSS 2007 was proposed for the Content Management and Collaboration among employees. We have created custom application pages and web parts to collect, display and manage ideas and contributions. Document libraries and list libraries were used to store contents to support ideas proposed by employees. The application pages developed were capable of interacting with third party "ideation" systems. Using the Web Parts developed, employees were able to customise pages depending on their interest and requirement.

BENEFITS

By implementing the "ideation" system in SharePoint, XXX was able to significantly enhance its Collaboration and Content Management capabilities. This solution helped the company improve working environment, find better solution for the challenges they faced, bring up innovative ideas, increase productivity and increased Collaboration among employees.
